TITLE: Problems in the design of instruments with elastic sensitive elements

PERIODICAL: Izmeritel'naya tekhnika, no.8, 1961, 9-13

TEXT: The present work deals with instrument design without systematic error because accurate and not approximate relationships are used. It also considers improvements in overall accuracy resulting from the use of a sensitive element with non-linear characteristics. The output signal of the equipment is a function of the pressure applied to the pick-up but the pressure sensitive element of the pick-up itself has a pressure response characteristic and it is first shown that the shape of this characteristic governs the accuracy of the instrument as a whole. To this end error expressions are derived for sensitive elements with linear, logarithmic and exponential characteristics. When this has been done, then sensitive elements which give the minimum error in particular cases can be selected. A numerical example is given for an instrument measuring the Mach number,  $M$ , by an aerometric

Card 1/2

4

Problems in the design of instruments... S/115/61/000/008/002/009  
E194/E119

method.  $M$  can be expressed as a function of the ratio of the static and dynamic pressures, e.g. graphically. Three methods of finding  $M$  are then possible: 1) by determining the static and dynamic pressures and finding their ratio (linear method); 2) by measuring the logarithms of the pressures and working from the difference; 3) by using an exponential equivalent to the relationship between  $M$  and the static and dynamic pressures and determining convenient and appropriate functions of the static and dynamic pressures. Error equations are given for these cases and it is shown that the error in determining  $M$  depends upon the pressure law transmitted by the pick-up. It is shown that at low pressures the error of  $M$  is greater in linear pick-ups than logarithmic. It is also concluded that in designing instruments to measure  $M$  over a wide range of static and dynamic pressures the pick-up should have logarithmic characteristics whereas for low altitudes (high dynamic and static pressures) the linear elements should be linear. The suitability of exponential pick-up characteristics must be determined separately in each particular case. There are 5 figures, 1 table and 3 Soviet-bloc references.

TITLE: A semiconductor transducer for converting a continuously varying voltage into an on-off electric signal

PERIODICAL: Priborostroyeniye, no. 3, 1963, 23-24

TEXT: A short description of a contactless phase-sensitive transistor circuit which transforms an a.c. voltage into an on-off d.c. signal. The circuit consists of a directly coupled complementary pair of transistors with heavy positive feedback to the base of the second (collector of the first) transistor, the latter being in grounded collector connection. Since the supply of the second transistor is through a diode, from a source having the same frequency as the input signal, the arrangement is phase-sensitive, the heavy positive feedback producing an on-off operation of the pair. There are 3 figures.

TITLE: On the initial stage of an electric discharge in water

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 4, 1964, 103-113

TOPIC TAGS: electric discharge, ionized gas, heat transfer, dissociated gas, discharge column, gas pressure, plasma conductivity

ABSTRACT: The process of an electric discharge column spreading in water was discussed analytically for small spreading rates and zero magnetic forces. A theoretical model is constructed on the basis of small  $dR/dt$  ( $R$  - column radius) assumption which leads to linear acoustic approximations that satisfy Laplace's equation  $\Delta\phi = 0$  and the linearized Euler momentum equation. This in turn leads to an expression for the pressure around the discharge column given by

$$p - p_0 = -\rho_0 \frac{\partial \phi}{\partial t} - \frac{\rho_0}{2} \left( \frac{\partial \phi}{\partial r} \right)^2$$

. Dissociative heat transfer in a thin layer around the discharge column is considered to be the primary source of energy loss, and for a planar geometry and constant mass flow rate the temperature distribution

Card 1/2

ACCESSION NR: AP4044725

is described by the equation

$$\frac{dT}{dz} = -\frac{R_p}{2\pi r_0} 5.5 [(1 + \alpha) - T_1] \quad . \quad \text{Analysis shows this}$$

transition layer to be of the order of  $10^{-5}$  cm. The temperature within the column is determined using conduction-diffusion equation with Saha's equilibrium ionization expression for temperature estimates not exceeding 15000C. A mean adiabatic coefficient  $\gamma$  is determined for water in the 9000-16000C temperature range and 500 to 2000 atm range ( $\gamma = 1.21$ ), and from an energy balance equation an expression is derived for column expansion rate  $u$  given by

$$u^4 \left( \ln \frac{2\epsilon}{u} - \frac{1}{2} \right) = \frac{N_0 (\gamma - 1)}{2\pi r_0}$$

versus time curves are calculated using experimentally determined column radii. This is done by means of photographing the discharge. "The authors thank S. I. Braginskiy for helpful discussions." Orig. art. has: 16 formulas and 6 figures.

TITLE: A contribution to the theory of the initial stage of electrical discharge in water

SOURCE: Zhurnal prikladnoy mekhaniki i tekhnicheskoy fiziki, no. 6, 1966, 69-72

TOPIC TAGS: electric discharge, electric circuit, circuit design

ABSTRACT: Experiments on electrical discharge in water demonstrate that such variables as electrical current in the circuit, voltage, channel radius, discharge radius, pressure in the compression pulse, as well as the change in these variables in time may apparently be defined in terms of four given parameters, i.e., initial voltage on capacitor,  $V_0$ , inductance,  $L$ , of the discharge loop, capacitance,  $C$ , of charging capacitor, and length,  $l$ , of interelectrode space. In order to describe behavior of discharge in time, an attempt is made to construct a system of equations which must also include variables characterizing the electrical discharge circuit and those referring to the discharge channel formed by breakthrough. Solution of the system should show the time dependence of the variables which are of interest. The author considers the electrical discharge circuit to be an ordinary oscillatory loop with given  $L$  and  $C$ , but with loop resistance entirely determined by the discharge

Card 1/2

ACC NR: AP7003254

channel resistance which varies in time. The discharge channel is a cylinder expanding in time. The author starts from the usual oscillatory circuit equation and taking temperature factors into consideration derives solutions for eight cases illustrated by graphs in addition to equations. The author thanks Yu. P. Rayzer for advice and consideration, and K. A. Naugol'nykh and N. A. Roy for valuable discussions. Orig. art. has: 12 formulas and 8 figures.

production engineering,

TOPIC TAGS: signaling device, contactless signaling device, amplifier design,  
electric relay, electronic circuit, electronic signal, remote control

ABSTRACT: A device (see figure) for signaling the completion of a specified mechanical (small) movement is described. Two identical differential transformer-type motion transducers 1 and 2 connected in opposition feed an amplifier-relay. The armature 3 position depends on the measurand. The armature 4 position is preset. At a definite point of armature 3 movement, the relay operates and sends off a signal. These characteristics of an experimental model are claimed: dead zone, 5 with input voltage up to 10 mv and

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 20, 1965, 64

TOPIC TAGS: rubber, ozone, antiozonant, cerisin, paraffin, petrolatum/ AF antiozonant mixture

ABSTRACT: This Author Certificate presents a method for obtaining rubber by applying a waxlike antiozonant. To increase the resistance of rubber to ozone, mixture AF, consisting of natural cerisin (50-70 wt parts), synthetic cerisin (20-5 wt parts), paraffin (40-10 wt parts), and petrolatum (10-0 wt parts), is used as the waxlike antiozonant. Mixture AF may be applied together with chemical antiozonants.

TITLE: Use of electronic simulation for studying the hydropneumatic system of the feed mechanism on a pilger mill

SOURCE: Ukraine. Ministerstvo vysshego i srednego spetsial'nogo obrazovaniya. Gidroprivod i gidropnevmoavtomatika (Hydraulic drive and hydropneumatic automation), no. 2, Kiev, Izd-vo Tekhnika, 1966, 45-50

TOPIC TAGS: rolling mill, pneumatic servomechanism, hydraulic device, computer application, analog computer

ABSTRACT: Electric simulation is used for studying the operation of the feed mechanism on a pilger mill. This method consists of using an analog computer for solving the equation of motion of the moving masses in the mechanism. Shown in the figure is a feed mechanism for production of seamless tubes 219-325 mm in diameter. The unit contains a hydraulic brake consisting of housing 4 with diaphragm 6. Inside the housing is tapered plunger 9 with a rod rigidly connected to plunger 3. The entire braking system is filled with water which is fed in at a pressure of  $58.9 \cdot 10^4$  N/m<sup>2</sup>.

Card 1/3

ACC NR: AT7000712

Rolls 1 move sleeve with mandrel 2 as well as plungers 9 and 3 from the extreme left-hand position toward the right. During this process, water from the main line flows through check valve 5 into cavities A and B. After completion of rolling, the moving

masses are braked by compressed air in chamber C and begin to move toward the left. On the return path, water from cavity B flows freely through valve 7 into the waste line until the end of the tapered plunger covers the diaphragm. At this point, the fluid pressure in chamber A rises and valve 7 cuts off the waste line. This begins braking of the moving masses. The fluid in chamber A is forced through the annulus between the tapered plunger and the diaphragm into chamber B and through pressure valve 14 into the waste line. Valve 14 is used for regulating braking conditions. The length of the braking path is adjusted by using screw 10 for setting piston 12 in measuring unit 11. When plunger 9 enters diaphragm 6, piston 12 is moved by fluid pressure to the extreme right-hand position. This action delivers a fixed quantity of fluid to

Card 2/3

ACC NR: AT7000712

the cylinder of measuring unit 11 without resistance, so that there is no braking force on a given section of the braking path. When piston 12 stops in the extreme right-hand position, braking force develops in the hydraulic braking system. After completion of braking at the beginning of the rolling process, spring 13 returns piston 12 to the original position while spring 8 returns slide valve 7 to the neutral position. Electronic simulation was used for studying motion of the masses in this mechanism as a function of their magnitude, the working capacity of the feed mechanism was determined and operation of the hydraulic brake was checked with variations in parameters. The program included simulation of both the acceleration and braking of the moving masses. The resultant data show that an increase in air pressure considerably reduces the operating cycle of the mechanism accompanied by a sharp increase in deceleration of the moving masses past the permissible value. An increase in the gap between the tapered plunger and the diaphragm to more than 0.4 mm results in an excessive final velocity of the moving masses during braking. Repair measures are called for when the clearance reaches this limiting value. The given data agree with those of dynamic computation. Orig. art. has: 5 figures.

<p>10FFE, A-V.</p> <p>ca</p>		<p>PROCESSING AND PROPERTIES INDEX</p> <p>Spectral distribution of the inner photoeffect in copper oxide. A. V. Ioffe and A. P. Ioffe. <i>Physik. Z. Sowjetunion</i> 11, 241-22(1937)(in English).-- The fundamental max. of the spectral curve of the photocond. of Cu<sub>2</sub>O at 630 mμ has no simple phys. meaning. It is displaced toward shorter wave lengths with decreasing thickness of the oxide layer. At a thickness of 9 μ the spectral curve of the photocond. practically reaches the curve of the photoeffect of a blocking layer, which has a max. at 540 mμ. Besides the photocond. in the visible spectrum, photocond. of the same order of magnitude is also observed in the ultraviolet, with a max. at 290 mμ. The photocond. per unit of incident energy is for some samples greater in the ultraviolet than in the visible. The photocond. is independent of the wave length in the visible. It decreases a little toward shorter wave lengths, evidently because insufficient account was taken of reflection of light from the surface. The deviations in the far red are due to the appearance of a second absorption band. The connection between the temp. coeff. of the elec. cond. and the limit of photocond. is not verified for Cu<sub>2</sub>O, which corresponds completely to the current mechanism established for this substance.</p> <p>Harold Gershinowitz</p>

LOFFS, A. V.

"Resistance of a Semi-Conductor on the Boundary with a Metal," Dok. AN 27, No. 6, 1940.

Physico-Tech. Inst. AS, Leningrad.

The image shows a microfiche card containing a document page. At the top, there's a header area with the title "PROCESSING AND PROPERTY INDEX". Below this, the main title of the document is "CONTACT OF SEMICONDUCTOR WITH METALS" followed by the authors "A. V. LOFFE and A. F. IOFFE. Bull. acad. sci. U. R. S. S., Ser. phys. 9; 580(1941); cf. C. A. 34, 70870." The abstract or summary follows: "--Dependence of the resistance of the semiconductor in contact with metal on the contact potential difference was studied. For high resistances the dependence is slight, but is particularly strong for materials of low resistance." The author "G. M. K." is listed at the end of the summary. On the left side of the card, there's a vertical label "CARD NO. 11". On the right side, there's a vertical label "CARD NO. 11". In the bottom left corner, there's a section labeled "ASM-ILA METALLURGICAL LITERATURE CLASSIFICATION" with various codes. In the bottom right corner, there's another section labeled "1980S MIP ONE" with more codes. Handwritten marks include a large "A" in the top left, a large "M" in the center, and a small "R" in the top right.

**IOFFE, A.V.**

Electrical resistance of the contact between a semiconductor and a metal. A.V. Ioffe. J. Phys. (U.S.S.R.) 10, 49-60(1946).--In order to study the mechanism of current rectification at the boundary of a semiconducting layer on a metal the contact resistance and potential of the semiconductor and a metal were investigated with currents in both directions. For the semiconductors CuO, UO<sub>2</sub>, CoO, V<sub>2</sub>O<sub>5</sub>, TiO<sub>2</sub>, ZnO, NiO, CdO, Ge it was found that, close to metal, there arises a considerable addl. resistance when an electron semiconductor borders on a metal possessing a higher contact potential or when a hole semiconductor borders on a metal having a lower contact potential. The contact potentials were found to be independent of the temp. and of the specific cond. The cond. was estd. and its dependence on the potential difference, temp. and current direction was studied. Feeble rectification was observed. S. E. Whitcomb.

Relaxation processes in rectifying contact layers.  
A. V. Ioffe and A. M. Ioffe. Zhur. Tekh. Fiz. 22, 10, 22 (1956). The behavior of the pairs  $\text{CuO} + \text{TiO}_2$ ,  $\text{CuO} + \text{ZnO}$ ,  $\text{UO}_2 + \text{TiO}_2$ ,  $\text{CaO} + \text{TiO}_2$ ,  $\text{UO}_2 + \text{ZnO}$ ,  $\text{CuO} + \text{WO}_3$ , and  $\text{TiO}_2 + \text{WO}_3$  is typified by that of  $\text{CuO} + \text{TiO}_2$ . In building up the barrier layer, step 1, lasting only a small fraction of a sec., is the attainment of diffusion equil. of the conduction electrons in the contact film of the boundary layer. This produces a resistance greatly exceeding that of the main mass of the semiconductor. The resistance of the barrier layer then spontaneously increases at a decreasing rate over a period of min. or hrs. If an external voltage  $V$  is then impressed on the rectifying junction, the resistance increases in the barrier direction and decreases in the opposite direction, at a rate proportional to  $V$ . This change is accompanied by polarization. The mechanism is as follows: after step 1, the electric field of the contact layer displaces ions of the added elements toward the electrode. The external field, coming at this layer, has the same effect on the entire mass of ions in the case of a barrier current. Both processes are slowed down by the back-diffusion of ions from the boundary into the body of the semiconductor, where the concn. of ions is very low. However, the concn. of neutral atoms decreases rapidly in the barrier layer. Both factors lead to diffusion of ions and atoms to the boundary from the semiconductor. In the contact layer, equil. for ions is attained when in each elemental cross section the no. of ions introduced by the field equals the no. lost by diffusion. The diffusion of ions changes their distribution in the barrier layer, causing their concn. to decrease from the external boundary of the layer toward the interior of the semiconductor. Throughout the whole process the ionic charges should compensate the difference of potentials at the barrier layer. The concn. of electrons is detd. by the curvature of the zone. Resistance and polarization e.m.f. are calc'd. theoretically as a function of  $V$ , and agree well with expt. from  $-180^\circ$  to  $+40^\circ$ .  
A. V. Ioffe

✓ On the Question of Correlation of the Thermal Conductivity of Semi-Conductors with the Mobility of the Electrons. A. V. Ioffe and A. P. Ioffe (Zhur. Tekhn. Fiz., 1954, 34, (10), 1911).—[In Russian]. Errors are pointed out in a paper by Goldsmid (Proc. Phys. Soc., 1954, (B), 67, 380. M. A. 23, 231). The mean free paths ( $\bar{l}$ ) of phonons and electrons are not of the same order of magnitude. Examples of semi-conductors—diamond, Si, Ge, PbS, and Te—show that  $\bar{l}_{\text{phonon}}$  is from 5 to 100 times less than  $\bar{l}_{\text{electron}}$ . The ratio of mobility  $\mu$  to thermal conductivity ( $\kappa$ ) is not approx. the same for various semi-conductors. For two of the examples (InSb and PbS), the values of  $\mu/\kappa$  differ by a factor of 0.13. For some semi-conductors  $\kappa$  finds that  $\mu/\kappa$  increases almost proportionately with at. wt. A. 1 and 1. It is also shown that for SnS  $\mu/\kappa$  is 6 times smaller than for InSb. In fact, for solids of similar crystal structure  $\mu/\kappa$  increases with increasing at. wt., while for some structures (e.g., C, Si, Ge, and Sn) the mobility increases with at. wt. However, it is not possible to generalize without taking into account the nature of the chem. binding and the phonon spectrum.—A. V. B.

Title : Effect of admixtures on the heat conductivity of semi-conductors

Periodical : Dok. AN SSSR 98/5, 757-759, Oct 11, 1954

Abstract : Experiments to evaluate the effect of foreign admixtures on the heat conductivity of semi-conductors are described. The various laws governing the heat conductivity magnitudes of semi-conductors are cited. Measurement of the specific-heat conductivity of solid solutions of numerous semi-conductors showed that foreign admixtures should be evaluated not only by the number of introduced atoms but also by the extent of distortions in the lattice resulted by each of the side atoms. The measured heat-conductivity values of solid solutions with large admixtures are given in tables. Three USSR references (1952 and 1954). Tables; graphs.

Title : Brief communication. Heat conductivity of oxides of elements in the second group of the periodic system

Periodical : Zhur. tekhn. fiz., 25, No 9 (September), 1955, 1659-1661

Abstract : In an earlier work (A. V. Ioffe, A. F. Ioffe, DAN SSR, X, No 5, 7, 821, 1954) it was shown for elements of the 4th group and for alkali-halide salts that their specific heat conductivity decreases with increase in atomic weight and that furthermore for identical atomic weight the heat conductivity of atomic lattices exceeds in order of magnitude the heat conductivity of ionic compounds. On the suggestion of A. F. Ioffe the present writers undertook the investigations described in this note with the purpose of verifying the applicability of the above conclusions to other substances, especially to clarify whether a comparatively weak difference in the character of the crystallochemical bonds is reflected along with the dependence upon atomic weight varying in the limits from 9 (Be) to 200 (Hg). For study the authors choose the oxides BeO, MgO, CaO, ZnO, SrO, CdO, BaO, HgO. Their measurements confirm the systematic lowering of heat conductivity with increase in atomic weight for all the oxides except BeO and MgO (which have structure of porous powder). They thank G. N. Gordyakova for preparation of the specimens.

TITLE: Thermal Conductivity <sup>21</sup> of Solid Solutions of Semiconductors

PERIODICAL: Fizika tverdogo tela, 1960, Vol. 2, No. 5, pp. 781-792

TEXT: The paper under review deals with the clarification of the rules governing the thermal conductivity of solid solutions of semiconductors on the basis of comprehensive experiments, and especially with phonon scattering from impurities. Ye. D. Davyatova investigated the temperature dependence of the thermal conductivity of solid solutions of (PbTe+PbSe).<sup>21</sup> She discovered that the thermal conductivity of this substance decreased with temperature, and that all the less the higher the concentration of the impurity. The authors had already measured the concentration dependence of the thermal conductivity of selenides and tellurides of lead, mercury, bismuth, antimony, and tin. They express their gratitude to T. S. Stavitskaya, L. M. Sysoyeva, G. N. Gordyakova, and G. V. Kokosh for having placed the preparations at their disposal. The investigation of semiconductors with broad forbidden zones (ZnSe, ZnTe, CdSe, CdTe) is described next.

These semiconductors possess cubic lattices, and their thermal conductivity does not depend on the crystallographic direction. The thermal conductivity of solid solutions of ZnTe-CdSe as dependent on the previous annealing is shown in Fig. 1. Data on the mechanism of heat conduction are discussed in detail. The longitudinal and transverse velocities of heat propagation (phonons) in the system ZnTe-CdTe and their mean velocity are listed in Table 1. The effects of low and high concentrations of impurities are investigated, and the conductivity of some solid solutions of tellurides and selenides as dependent on the impurity concentration is illustrated in Figs. 2-7. The various physical data obtained in the experiments are listed in Tables 2 and 3. Investigations of the solid solutions of  $\text{Ba}_2\text{TiO}_3$ - $\text{Ba}_{0.5}\text{MoO}_3$ ,  $\text{SrTiO}_3$ - $\text{Bi}_{2/3}\text{TiO}_3$  (obtained from G. A. Smolenskiy), and  $\text{Sb}_2\text{Te}_3$ - $\text{Sb}_2\text{Se}_3$  are illustrated in Fig. 10. The authors thank B. Ya. Moyzhes, and express their gratitude to P. V. Usachev, A. V. Golubkov, and N. S. Volosatova for preparing the series of solid solutions, to A. I. Zaslavskiy for the X-ray structural analysis, to Yu. V. Ilisavskiy and A. G. Ostroumov for measuring the ultrasonic velocity, and to P. I. Mikhaylova for her assistance in measuring the thermal conductivity. There are 10 figures, 3 tables, and

ACCESSION NR: AP3006805

the  $\text{Bi}_2\text{Se}_3$ — $\text{Sb}_2\text{Te}_3$  and  $\text{Bi}_2\text{Te}_3$ — $\text{Sb}_2\text{Se}_3$  systems. The calculated values of the thermoelectric figure of merit ( $Z$ ) were correlated with composition. Data for the systems studied are not available in the literature. Alloys were prepared by melting mixtures of the high-purity elements in the required proportions in evacuated sealed quartz ampuls. The alloys were vacuum annealed, hot pressed into specimens, and quenched from 500C. All measurements were conducted with the same specimen of each alloy. Thermal conductivity by electrons ( $\kappa_{el}$ ), was calculated from the measured  $\sigma$ , and thermal conductivity by lattice vibrations ( $\kappa_l$ ) as the difference. Isotherms of  $\sigma$ ,  $\alpha$ ,  $\kappa$ , and  $Z$  for solid solutions in both systems studied are shown in Figs. 1 and 2 of the Enclosure. The following conclusions are reached. 1) Diffuse minima of  $\kappa_l$  and  $\sigma$ , characteristic of metals, exist in both systems at a 1/1 molar ratio of the components. 2) The peak  $Z$  values (at 33.33 and 66.66 mol%  $\text{Sb}_2\text{Te}_3$ ) in the  $\text{Bi}_2\text{Se}_3$ — $\text{Sb}_2\text{Te}_3$  system are 1.6 and 1.3 times the  $Z$  value for pure  $\text{Bi}_2\text{Se}_3$ ; the peak  $Z$  value (at 33.3 mol%  $\text{Sb}_2\text{Se}_3$ ) in the  $\text{Bi}_2\text{Te}_3$ — $\text{Sb}_2\text{Se}_3$  system is 7 times the  $Z$  value for

Card 2/3

L 1004-113

ACCESSION NR1 AP3000-05

pure  $\text{Bi}_2\text{Te}_3$ . 3) The sign of  $\alpha$  of the  $\text{Bi}_2\text{Se}_3$ — $\text{Sb}_2\text{Te}_3$  system changes from negative to positive at 42 mol%  $\text{Sb}_2\text{Te}_3$  and at 50 mol% reaches its maximum value, which is 2.5 times that of pure  $\text{Sb}_2\text{Te}_3$ ;  $\alpha$  in the p-type  $\text{Bi}_2\text{Te}_3$ — $\text{Sb}_2\text{Se}_3$  system reaches its peak value at about 40 mol%  $\text{Sb}_2\text{Se}_3$ . Certain discrepancies in absolute  $\alpha$  and  $\sigma$  values between this and a previous study (V. G. Kuznetsov, K. K. Palkina, A. V. Dmitriyev, Zh. neorgan. khimii, 8 [Abstracts notes 9], 2136 (1963)), are attributed to the fact that the impurity content of Te was higher in the earlier study. The patterns of  $\alpha$  and  $\sigma$  isotherms are similar in both studies. It was shown that the main component of  $\kappa_t$  in both systems is  $\kappa_1$ . Orig. art. has 4 figures and 1 table.

**AUTHOR:** This book is intended for metallurgical engineers, research workers in metallurgy, and may also be of interest to students of advanced courses in metallurgy.

**CONTENTS:** This book, consisting of a number of papers, deals with the properties of heat-resisting metals and alloys. Each paper is devoted to the study of the factors which affect the properties and behavior of metals. The effects of various elements and compounds on the heat-resisting properties of various alloys are studied. Permeability and weldability of certain metals as related to the thermal conditions are the object of another study described. The problem of hydrogen embrittlement, diffusion and the deposition of oxides on metal surfaces by means of electrophoresis are considered. One paper describes the apparatus and methods used for growing crystals of metals. Non-base metals are critically examined and listed. Metals are given of studies of interatomic bonds and the behavior of atoms in metal. Tests of turbine and compressor blades described. Personnel are mentioned. References accompany most of the articles.

Spravochnik po chugunnomu lit'yu (Handbook on Iron Castings) 2d ed., rev. and enl. Moscow, Mashgiz, 1961. 800 p. Errata slip inserted. 16,000 copies printed.

Reviewer: P. P. Berg, Doctor of Technical Sciences, Professor; Ed.: I. A. Baranov, Engineer; Ed. of Publishing House: T. L. Leykina; Tech. Eds.: O. V. Speranskaya and P. S. Frumkin; Managing Ed. for Literature on Machine-Building Technology (Leningrad Department, Mashgiz): Ye. P. Naumov, Engineer.

**PURPOSE:** This handbook is intended for technical personnel at cast-iron foundries. It may also be of use to skilled workmen in foundries and students specializing in founding.

**COVERAGE:** The handbook contains information on basic problems in the modern manufacture of iron castings. The following are discussed: the composition and properties of the metal; the making of molds; special casting methods; the charge preparation; melting

Card 1/1

Handbook on Iron Castings

SOV/5458

and modifying the cast iron; pouring, shaking out, and cleaning of castings; heat-treatment methods; and the inspection and rejection of castings. Information on foundry equipment and on the mechanization of castings production is also presented. The authors thank Professor P. P. Berg, Doctor of Technical Sciences, and staff members of the Mosstankolit Plant, headed by the chief metallurgist G. I. Kletskin, Candidate of Technical Sciences, for their assistance. References follow each chapter. There are 287 references, mostly Soviet.

TITLE: A method for orientation of components. Class 49, No. 186253

SOURCE: Izobret prom obraz tov zn, no. 18, 1966, 145

TOPIC TAGS: automation equipment, material handling, pneumatic control

ABSTRACT: This Author's Certificate introduces: 1. A method for orientation of components using compressed air. The components are put into an oriented position by the action of an air jet with a force dictated by the conditions for producing the necessary leverage. 2. A modification of this method in which the spatial position of the component may be changed several times by placing it in a chute and moving it with respect to jet systems distributed along this chute. One of these systems acts as a clamp while the others provide the necessary leverage.

TITLE: Hermetically sealed piston pump. Class 59, No. 177778  
[announced by the Institute of Physics, Academy of Sciences, Latvian SSR (Institut fiziki Akademii nauk Latvyskoy SSR)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 1, 1966, 142

TOPIC TAGS: piston, ~~pump~~, pump, *hermetic seal*

ABSTRACT: This Author Certificate introduces a hermetically sealed piston pump containing a inductor, a duct, and pistons. For higher efficiency the pistons are made of electroconductive nonferromagnetic material with a ferromagnetic bushing placed inside the piston. For ease of construction, the pump is made with a braking inductor for stopping the pistons in the delivery zone (see Fig. 1). Orig. art. has: 1 figure.

TITLE: Experimental investigation of an electromagnetic rotary displacement pump

SOURCE: AN LatSSR. Izvestiya. Seriya fizicheskikh i tekhnicheskikh nauk, no. 4, 1966, 87-92

TOPIC TAGS: fluid pump, electromagnetic pump, hydraulic pump

ABSTRACT: The authors describe the operating principles and the results of the first tests of a new type of electromagnetic induction pump, developed at the Institute of Physics of the Latvian Academy of Sciences, for the purpose of pumping conducting corrosive liquids. The pump uses no stuffing glands or bearing units, nor are valves required for the operation (Fig. 1). The construction of the test pump is described. Test results of pumping water and a solution of emulsifying oil of different viscosity are described. The described model was aimed only to check on the feasibility of the operating principle, without attempting to obtain optimal construction or high efficiency. The efficiency can be increased by improving the electromagnetic and hydraulic units. Ways of improving the design are briefly discussed. The authors thank Doctor of Physical and Mathematical Sciences I. M. Kirko and Candidate of Technical Sciences G. G. Branover for valuable advice and recommendations during the

TITLE: Plate-type hermetic pump. Class 59, No. 188847. [announced by the Institute of Physics, AN Latvian SSR (Institut fiziki AN Latvyskoy SSR)]

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 22, 1966, 154

TOPIC TAGS: pump, fluid pump, hydraulic pump

ABSTRACT: An Author Certificate has been issued for a plate-type hermetic pump consisting of a pipe-line inductor, plate holders, and plates. To simplify its design, the casing is made in the form of a closed annular duct. To assure its tight closing and for the automatic compensation of hydraulic-pressure wear on the operating plates' surfaces the plates' external axis of rotation is relative to the plate holder.

efficient design. For example, in the year 1956, the plant produced 22 different types of machine tools, with an average of 2374 parts for each type. A unification effort resulted in standardization of 84% of all sub-assemblies and components used. A report on the plant's experience in developing and introducing modern advanced technology is included. The examples of improved technological processes are described as useful for other metalworking enterprises. There are no references.
